

Earth day is a day where people clean up the environment from all the trash that people have littered all over the world. We need to do this more so we can stop climate change. Climate change makes more severe weather events happen more often. If we do not stop climate Change Louisiana will be underwater in 40 years because the ice caps will melt. Also how much snow Vermont gets in a year will go down by a lot. That mean a lot less skiing and other amazing winter activities.

Some people that are making an attempt to stop this is Greta Thunberg she protest outside of government offices every friday. Then she went to the US but she didn't go on a plane, she rode Across the ocean on a boat so she didn't pollute the earth. Another thing is that we could use less gasoline methods of transportation and more electric methods of transportation. Scientists found a way to turn carbon that's in the air Into baking soda and store it in the ocean. I think they could bury it in the ocean or something like that.

Burning coal is a big contributor to climate change, coal causes about 20% of total; carbon dioxide emissions in the world. If we stopped burning coal that could help. The country that burns the most coal is china. They burn about 50% of the coal every year. It could be good if that number was lower.

I think we need to burn less fossil fuels so we can have the snow return every year so we can ski and other stuff. Do you have any ideas to stop climate change?
