Title of your essay goes here

My first reason why we need water is if we did not have water then what would we drink to stay hydrated? You probably think you could live off of a liquid that does not have water like a smoothie. But all the stuff you put in a smoothie requires water so could you? No you could not. If we did not have water we also would not be able to swim or even sled because snow is frozen water so if water was not a thing you would be swimming on the ground and sledding on the dirt. My last third and final statement of why we need water is if we did not have water then all the trees would not grow and we would not have oxygen because there would be no living source of it. As you can see if we can properly take care of our planet we will not lose water and die. One major issue facing our hydrosphere is flooding. Even though this is a major issue, there are still ways to solve this.

Flooding and climate change is a big problem in our world but why? One reason why climate change will affect flooding is if the climate gets warmer. Then the air will get humid and clouds will hold more water. It will affect flooding because there is more rain and heavier rain so there will be so much rain then all the water coming down we will not be able to control. My second reason on why climate change and flooding is bad is if there is more water in the ocean then it will get more full. All this water will make the ocean really full and it could sink islands. Also scientists think the water will rise by 8 inches by 2030 to 2050. My third and final reason why flooding and climate change will affect us is if we keep letting this happen then everything would be under water. Like in some places they are getting three feet of rain and dams are breaking open with water and flooding everything. So if we don't want this to happen then let's learn how to fix it.

If we want to stop floods then what will we do? One way is if you get solar panels. Solar panels stop gasses which is climate change so if we have them we would not make climate change. My second way will be how we can do this another way. If we stop driving everywhere so much then we won't make gasses for example, if there is an unnecessary place to drive them, why waste the fuel and create gasses to get released and make the world hotter. One thing we can do is make dams stronger so the water that overflows from lakes and rivers does not flood. If this happens then it could destroy cities and towns with water so if we make it stronger then we will live longer.

As you can see, if we take care of our planet then we will survive and not get our towns, cities and houses flooded. What you learned in this passage is how to take care of our planet and make it not flood. It is very important to take action because if you don't we will die from climate change and flooding.

If we don't do anything then the world might end because of climate change and flooding.
So if we make it stronger we will stay longer.
