Teachers: Karen Dilorio-Bowen, Cate Hagarty*

I love the wildlife and forests in Vermont because it is a calm, quiet place to think. I like to explore different places in the forest and learn about different animals. I also like the streams and rivers. They need to stay clean so people can have fun in the water.

I enjoy the environment by ice skating on the meadows and hiking up different mountains. My favorite mountains to hike are Mount Mansfield, Mount Wantastiquet and Black Mountain. I ice skate on the meadows of the Retreat Farm and that's also where people ice fish.

I care most about the forests because they have a ton of animals living in them. We need the forest because it takes in carbon dioxide and lets us have clean air. Vermont's forests, streams, rivers and lakes make Vermont a rural place in America.

Earth day to me means to appreciate the earth and clean up litter, plant more trees and recycle but we should still do all those things every day. In our school the classes go out and pick up trash on Earth Day. If we clean up the earth we will get more snow and have more fun without the pollution.

My concerns about the future environment of Vermont are if we don't plant enough trees to start to make climate change a little less of a problem then the North and South poles will start to melt and different species of animals will go extinct. I also have a concern about the trash in the ocean and more plants and animals will be hurt. We need to do the opposite of what we were doing to pollute the planet.

The changing of the environment due to climate change will impact it by making the snow melt so we can't go skiing, snowboarding and

sledding. The warmer weather will also make mosquitoes stay longer and into a different season and they will injure more animals and humans. It will impact a lot more things and the world will change.

In the video, Nature Now I learned we can protect Vermont's environment by not spending on fossil fuels and not burning fossil fuels and protecting, restoring and funding. We need to protect the forest from being cut down. We need to restore the forests and plant more trees and we need to fund money into buying plants and trees that will help the environment grow back. If we do these things then climate change will start to get better!
