introduction

A lot of animals die each year because of things like. Wildfires, pollution, oil spills and littering. Animals will go extinct if we don't take care of the earth.

Reason 1

One reason is that wildfires are really dangerous for animals to be around. For example animals don't know what to do around fires. In addition animals like sloths live on trees and when there's a fire they can't do anything. Fires spread fast especially in nature. When there's a wildfire so much fog appears that you can't even breathe.

reason 2

Littering has a bunch of effects on earth, But there are ways you can help. To start off when litter gets in the ocean animals can eat it and die. Litter can also cause fires, Lightning is also a way a fire can start. Animals die because of littering no matter sea or land. We can help by picking up litter when we see it even in the ocean.

### Reason 3

Oil spills has a really big impact on the world the first oil spill was on December 15, 1976. Oil spills happen because factories they throw oil away in the sea. A lot of the time oil pipes crack or burst causing a lot of oil to get in the sea. People that work at oil factories throw away oil in the sea when something goes wrong with the oil. We can help by using less oil and use more electricity it won't solve this problem but it would effect it and help.

### Conclusion

There are a lot of problems in the world we need to solve. But we must start with the ones with the most effect. A lot of people love animals but a lot of animals are coming to extinction. We can start with that. I hope you understand and want to help just like me.
