Vermont and Earth

Did you know that Vermont and the Earth are struggling? Vermont is a very interesting place to live. Just like our Earth too. They both have changed drastically in the past 50 to 100 years. And if we don't try to stop this then we will not only lose our Earth, we will lose our home.

Now Earth isn't doing the best either, like a bunch of animals are going extinct and when they are gone, they are gone forever. There are only about 440,000 elephants left in the whole world, and there are only about 80,000 narwhals left in the world. And that isn't good, because if we lose all of our animals, then we lose a lot more than just our animals. Like if we lose any animals that give us food then we won't have that food anymore, or if all of our land is polluted then our plants aren't going to be healthy and they will die. And if we lose plants then we could lose farmers and that would make the world and Vermont less money. We can start to solve this problem by not littering, wasting stuff, and keeping our land and ocean clean.

Vermont 50 years ago used to get about 5 to 8 feet of snow, now this past winter we only got maybe 1 ½ to 3 feet of snow. Getting a bunch of snow is basically one of Vermont's biggest reputations, along with maple syrup which the past couple of years have not been the best maple season's, and that isn't good for Vermont because maple syrup is a big part of Vermont's economy. We need to stop global climate change so Vermont can get back to being Vermont.

We also need to stop all of the pollution and keep our plants, ocean, and land. Which we can do by throwing trash in the garbage and not on the land and not put our plastic in the ocean and put in the recycling and just stop destroying our planet. Most people are sick of walking out of their house in the city and seeing trash and black smoke in the air or walking out and seeing trash bags laying on the sidewalk. And I know I'm sick of walking around and seeing trash bags, black smoke, and plastic in the river. It hurts to think that this is what our Earth is like and we need to help make it better as soon as we can.
